Host a Website on Amazon S3

Mhd Roman

Introducing Today's Project!

In this project, i will demonstrate hoe touse s3 to host a static website. I'm doing this project to learn about AWS and cloud services and how they can be used to store objects in cloud and even host websites.

Tools and concepts

Services I used were Amzon S3 Key concepts I learnt include bucket policy, endpoint URLs , upload files and folders to s3 bucket, and ACLs and how they control to our bucket subjects

Project reflection

This project took me approximately 1.5 hours including demo time and practice time learned about something new.The most challenging part was removing 403 forbidden error It was most rewarding to our webpage to live to public.

How I Set Up an S3 Bucket

Creating an S3 bucket took me under 5 minutes in this process i have learned about ACLs and public access barrier in AWS after i learned this all we can create s3 bucket even shorter time in near future

The Region I picked for my S3 bucket was Asia pacific because it's the region closes to me

S3 bucket names must be globally unique across all AWS accounts. This means that no two buckets can have the same name, even if they're created by different users.

Upload Website Files to S3

index.html and image assets

I uploaded two files to my S3 bucket - they were our website files one is index.html file this file decide the webpage and i have upload the unzip folder of images.

Both files are necessary for this project as index.html determines the structure of the website index.html only says this picture should be here this picture should be here but we have to upload those images that's why we upload many files

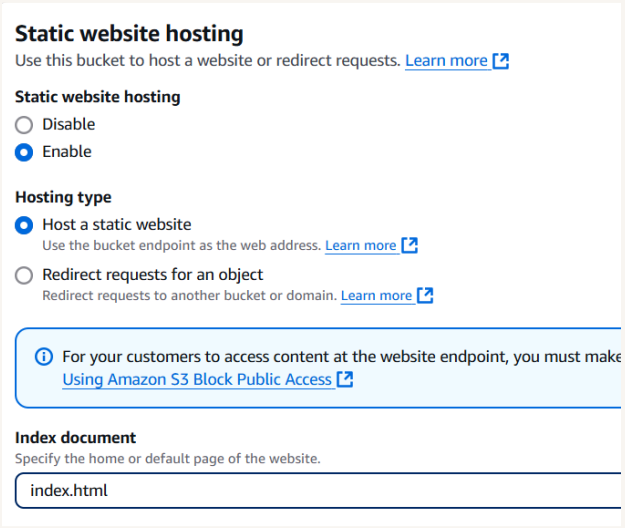

Static Website Hosting on S3

Website hosting means putting our website files to webserver which is computer design to turn our website to a website page that people can visit

To enable website hosting with my S3 bucket, I went to the properties tab in our bucket enable static web hosting and we also lable index.html as our index document

An ACL in AWS is a mechanism that defines permissions for controlling access to S3 buckets and objects.So we enable ACLs so we can control access to our website.

Bucket Endpoints

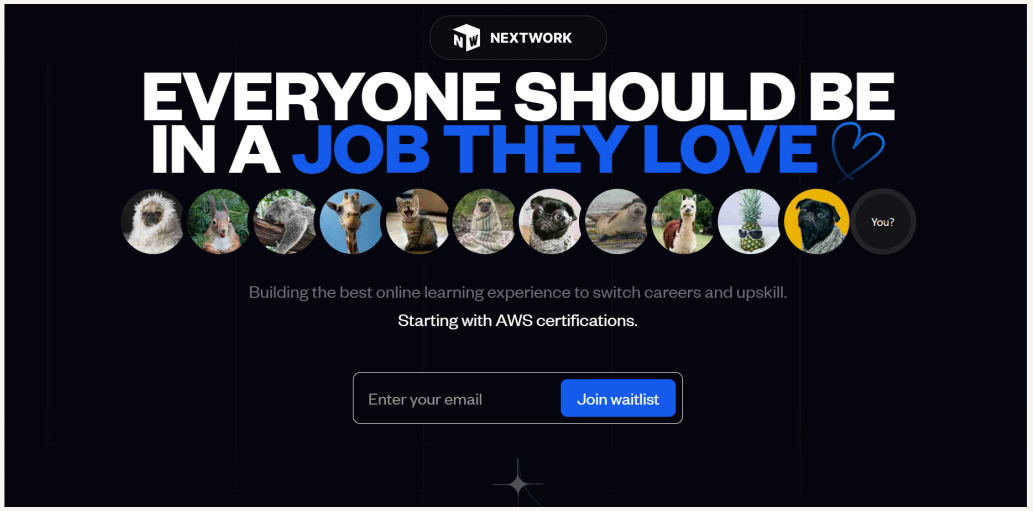

Once static website is enabled, S3 produces a bucket endpoint URL, which is the URL that takes anyone in the internet to our hosting static website

When I first visited the bucket endpoint URL, I saw an error this error called 403 forbidden error. The reason for this error was in our bucket files are private in our s3 bucket. they need to be public files to visiting our website to public

Success!

To resolve this 403 Forbidden error, I go to the objects part and select my index file and folder and after select the actions button and make public using ACL and after that make public

The place to learn & showcase your skills
